

March 5, 2002

Dear DuPont Oust[®] XP Customer,

The Oust[®] XP volumetric measuring guide that is enclosed in each package of new Oust[®] XP herbicide indicates that it measures within 7.5%+/- accuracy. It has been found to actually over-measure the product by 12-16%. For example, that means that the 2 oz measurement mark on the guide equals approximately 2¼ oz of the product.

A more precise measurement can be obtained by using a scale to weigh the product. As always, read and follow the label.

A replacement Oust[®] XP measuring guide is being manufactured and will be available by early April. We will be mailing the new measuring guide to you as soon as it becomes available, along with information for obtaining more.

We apologize for any inconvenience that this may have caused you. Regardless of the measuring device, new Oust[®] XP still offers the same great performance as regular Oust[®], but it mixes better for more consistent coverage and better weed control.

Look for the new Oust[®] XP measuring guide in your mailbox in the upcoming weeks.

Best Regards,

The DuPont Vegetation Management Team
