1. Purpose of Evaluation
The proponent sought confirmation from the Canadian Construction Materials Centre (CCMC) that “Tyvek® Homewrap™” can serve as a breather-type sheathing membrane in compliance with the intent of the National Building Code of Canada (NBC) 1995.

2. Opinion
Subject to the limitations and conditions stated in this report, test results and assessments provided by the proponent show that “Tyvek® Homewrap™” complies with CCMC’s Technical Guide for Sheathing, Membrane, Breather-Type, Masterformat Number 07102, dated 97-02-12, and provides a level of performance equivalent to that required in:

- NBC 1995, Article 9.23.17.1.

Canada Mortgage and Housing Corporation permits the use of this product in construction financed or insured under the National Housing Act.
3. Description
“Tyvek® Homewrap™” is a spun-bonded olefin material made by combining continuous fibres of high-density polyethylene into a sheet through a process using heat and pressure.

The product is 0.15 mm thick and white in colour. It comes in rolls ranging in width from 0.91 m to 2.90 m and in length from 30.5 m to 60.9 m.

Roll material is applied over exterior sheathing material so that it forms a continuous envelope around the entire building. At vertical joints, the material overlaps 75 mm to 150 mm; at horizontal joints, 100 mm. Joints are taped and sealed around both window and door openings.

The product must be clearly identified with the following information: name of manufacturer or logo, and the phrase “CCMC No. 12808-R.”

Figure 1 illustrates the application of the product.

4. Usage and Limitations
The “Tyvek® Homewrap™” can be used as breather-type sheathing membrane, to reduce the risk of water infiltration, under commonly used types of exterior cladding, brick and stucco. The main purpose is to create a continuous envelope around the occupied areas of residential or light commercial construction. Such continuity is achieved by overlapping or sealing the product either to itself using CCMC-evaluated contractor sheathing tape, or to other construction materials with an acoustical sealant.

A conforming installation must be:

- installed with the printed side facing outward and must be protected from exposure to ultraviolet radiation from the sun within 60 days;
- installed according to Article 9.23.17.3. of the NBC 1995 and the manufacturer’s current instructions;
- installed with a minimum 10 mm air space between the sheathing membrane and the
cladding, unless the cladding has been deemed to not require an air space (e.g., deemed by CCMC or deemed by building officials based on past cladding performance); and

- it should be noted that a concealed air space exceeding 25 mm in width must contain proper fire stopping, in accordance with Subsection 9.10.15. of the NBC 1995.

5. **Performance**

Testing was conducted at an independent laboratory recognized by CCMC. The results of testing “Tyvek® Homewrap™” are summarized in Table 1.

### Table 1. Results of Testing “Tyvek® Homewrap™” to CCMC Technical Guide

¹ The Water Ponding Test requires that the membrane retain 25.4 mm of water with no passage of water through the membrane for 2 hours.
