

# JACOBS

One of the world’s largest and most diverse providers of technical, professional, and construction services, Jacobs has been recognized as a regional winner in the DuPont Safety and Sustainability Awards due to the company’s efforts in advancing sustainability performance, including through the ‘Sustainability+’ tool.

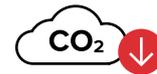

## JACOBS

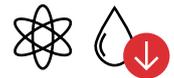

Aside from its work with clients to achieve sustainability objectives, Jacobs has also developed tools to help record, quantify, and report these value-adding activities. Launched in 2010, **Sustainability+** was a first of its kind data capture tool that tracks practices and ideas that when implemented, create value through

monetary savings

reductions in carbon footprint

or energy or water usage

Accessible to project teams worldwide, the tool also provides a legacy for future projects.

Founded in Pasadena in as a one-man engineering consultancy in 1947, Jacobs has evolved into a publicly traded company that generated \$10.9 billion in revenues in 2016, with more than 90 percent of its work coming from repeat business. Now headquartered in Dallas, Jacobs has 54,000 employees in more than 230 locations around the world. The company serves a broad range of industrial, commercial, and government clients, offering expertise in architecture, engineering and construction, operations and maintenance, as well as scientific and specialty consulting.

Jacobs’ commitment to integrating sustainability considerations across the full breadth of its operations is embodied in the company’s **7 Principles of Sustainability** which provide a visible value framework to guide best practices.

**7 PRINCIPLES**  
of Sustainability

As ‘Sustainability+’ has developed, Jacobs has expanded the range of metrics the tool can track beyond its initial focus on carbon emissions, capturing a more varied picture of sustainability performance (including social value initiatives). Savings can be identified at any stage in a project, though tend to be captured during the feasibility and preliminary design phases, incentivizing the early integration of sustainability thinking. Alongside regular growth in business performance since ‘Sustainability+’ has been operating, Jacobs can also point to the

saving of

**54.2 MILLION**

metric tons of CO<sub>2</sub> for clients in 2016

an increase of

**↑ 61%**

over client savings in 2015.
