MAXIMIZE SUSTAINABILITY AND PROTECT YOUR ASSETS BY LEVERAGING DUPONT EXPERTISE
ENVIROMENTAL MANAGEMENT
Our sustainability consultants address the widening array of risks related to cost volatility, competition, regulations and public and investor expectations that drive businesses to improve environmental performance. Applying DuPont best practices, as well as our ever-expanding knowledge from client engagements, our consultants can help you effectively manage a wide range of environmental risks, from carbon emissions and waste to water consumption and sourcing issues, while simultaneously creating sustainable supply chains and reducing your corporate footprint. They work with organizations to move beyond a simple corporate vision and isolated corporate social responsibility projects, instead integrating environmental planning within the framework of their business to reduce costs, effectively compete, attract investments and strengthen engagement with key stakeholders. Our solutions deliver early results while simultaneously allowing an organization to develop the strong management structures, processes and competencies needed to sustain and build upon its goals.

Our own continuous footprint reduction, as well as the redefinition of the DuPont business model around a successful sustainability management strategy, has earned the recognition of political leaders, civil society and numerous media outlets. In 2010 and 2012, Fortune Magazine named DuPont among its Top 50 Most Admired Companies in the World and Corporate Responsibility Magazine included DuPont in its 100 Best Corporate Citizens selection of 2011.

ENERGY EFFICIENCY
Over the course of its 208 year history, DuPont has developed and maintained a compilation of best practices in energy management that are utilized across its global operations. These best practices represent an extensive, proprietary collection of technical and management guidelines and performance criteria for operating, controlling and maintaining energy-intensive plant systems at top efficiency. This specialized knowledge has allowed DuPont to reduce energy use by 6 percent across its facilities worldwide since 1990, resulting in US$6 billion in cumulative savings.

Our energy efficiency consulting experts possess vast experience in operations, maintenance, strategy, energy management, equipment efficiency and cultural change. They approach energy management from a low to no-capital...
perspective, and work with you to assess, rate and prioritize energy savings opportunities – an approach proven to deliver significant results. Further, our consultants are versed in effective cultural change methodologies, and help your organization to form an energy-focused organizational structure and to establish strong managing processes to optimize the outcome and minimize the investment.

SUSTAINABLE ASSETS
Today, to increase shareholder value in spite of uncertain market demand and supply chain volatility, many businesses press for continuous improvements in operational performance, while minimizing costs. This often poses a significant challenge, as it requires not only technical knowledge to maximize the productivity of operational assets, but also management processes and organizational structures conducive to the optimization of efficiency.

At DuPont, we apply over 200 years of real-world experience to extract maximum value from our own operating assets. We have honed our processes, developed results-oriented key performance indicators (KPIs) and industry-leading best practices and standards. Our experienced consultants can apply this knowledge to help your organization to design and implement targeted solutions to improve operational efficiency and effectiveness. In doing so, your company can optimize asset productivity, product quality, uptime and yields, while realizing cost savings, higher revenue and profitability.

CAPITAL EFFECTIVENESS
Drawing on the experience gained in managing some of the world’s most significant capital projects, our capital effectiveness consultants bring a strict focus to planning, execution and operation, thereby driving excellent project results – an average of 10 – 15 percent increase in yield from an existing capital budget.

Our highly-structured approach relies on early and intense planning, front-end loading and a highly disciplined set of methodologies and management systems that deliver best-in-class results. Our consultants help your organization to define needs and requirements, and then customize a structured approach for planning capital project management activities, from front-end loading to project design, construction start-up and operation. Through implementation, our clients are able to mitigate risk, and deliver capital projects on time and below cost.
