Recommendation Sheet — Corn

DuPont™ Prevathon® insect control is labeled on corn, delivering remarkable protection. Optimize yield and quality by achieving reliable and consistent control of key insect pests in corn.

Key benefits of Prevathon®

- Long-lasting control of key worms on corn, providing higher yields and better quality.
- Helps break the insect resistance cycle due to its alternate mode of action versus current standards.
- Excellent crop protection — starts working right away by stopping insect feeding and keeps working for 14 to 21 days¹ to minimize and reduce the number of potential treatments. Prevathon® can be applied by air or ground and is rainfast once the spray has dried.
- Effective control of your key yield-robbing insect pests that infest corn — European corn borer, corn earworm, western bean cutworm and armyworms — while having minimal impact on beneficials.^{2,3}
- Does not flare mites.
- Because Prevathon® activity works through ingestion, contact and ovi-larvicidal properties, control can be assured within a wider application window. Start early at egg lay to prevent populations from developing and count on long residual to break the cycle.
- Allows you to better manage your corn crop when you need to due to the excellent worker protection standard profile of Prevathon®, a 4-hour reentry period and 1-day preharvest interval for seed corn and 14-day for field and pop corn.

¹ Untreated plant material may not be fully protected as a result of plant growth. During the period of rapid silking more frequent applications are typically necessary (e.g., 3–5 day spray intervals).

² When used in accordance with label directions.

³ In line with Integrated Pest Management and Good Agricultural Practices, insecticide applications should be made when pollinators are not foraging to avoid unnecessary exposure.

Corn earworm

European corn borer

Fall armyworm

Western bean cutworm

DuPont Crop Protection Corn Phenology⁴

April through June

Pre-tassel

DuPont™ Prevathon® insect control
14 to 20 oz/A
Broad-spectrum Lepidoptera control

Key pests:

- European corn borer
- Armyworms

Early tasseling to pollination

June through July

Prevathon® 20 oz/A (1 gal to 6.4 acres)

or

Prevathon® 14 oz/A

Key pests:

- Western bean cutworm
- European corn borer
- Corn earworm

Pollination to harvest

July through October

If needed, repeat:

Prevathon® 20 oz/A (1 gal to 6.4 acres)

or

Prevathon® 14 oz/A

Key pests:

- Corn earworm
- European corn borer
- Western bean cutworm

Key benefits of Prevathon®

- Maintains crop quality and improves yield by controlling the toughest ear-feeding pests
- Long-lasting control reduces the number of applications between brown silk and harvest
- Alternative mode of action to manage insect resistance

⁴ Do not treat successive generations of the same pest with the same mode of action. Please consult the product labels for additional guidance on best practices for Insecticide Resistance Management.
