## Product Description

DuPont™ Fodel® QM44F photoimageable thick-film composition is a Fodel® version of DuPont QM44 and the first silver compatible Fodel® dielectric. It should be used in circuits requiring small vias and precise geometries.

## Product Benefits

- Capable of forming 3 mil diameter vias
- Compatible with silver conductors
- Low shrinkage dried to fired (45%)
- Thin, 2 print dielectric film
- Robust electrical properties

## Design notes

Although testing indicates 25 mil vias can be photo imaged successfully, it is recommended to screen print larger features when possible.

## Compatibility

The dielectric is compatible with a full range of Ag and mixed metal conductors, including silver/palladium, silver/platinum, and gold conductors.

## Recommended Processing Procedure

### Using Safe Lighting

To prevent accidental polymerization, handle Fodel® materials under yellow or amber “safe lights” which have no UV, violet, or blue light wavelengths. Use safe lights in all areas where parts are printed, dried, exposed, and developed. Protect parts from all sources of white light unless these sources are carefully checked to ensure that they will not cause polymerization. To determine whether white light is present in your production area, turn off all yellow lights and look for any remaining white light. (This assumes that there are no white light leaks from yellow light fixtures). For additional information on Safe Lighting, refer to Fodel® Design Guide.

### Thinner

This composition is optimized for screen printing, thinning is not normally required. Use the DuPont recommended thinner for slight adjustments to viscosity or to replace evaporation losses. The use of too much thinner or the use of a non recommended thinner may affect the rheological behavior of the material and its printing characteristics.

## Typical Physical Properties

This table shows anticipated typical physical properties for Fodel® QM44F based on specific controlled experiments in our labs and are not intended to represent the product specifications, details of which are available upon request.
Printing
The composition should be thoroughly mixed before use. This is best achieved by slow, gently, hand stirring with a clean burr-free plastic spatula for 0.5 - 1 minute. Care must be taken to avoid air entrapment.

Printing should be performed in a clean and well ventilated area. Optimum printing characteristics are generally achieved in the room temperature range of 20°C - 23°C. It is therefore important that the material, in its container, is at this temperature prior to commencement of printing.

DuPont™ Fodel® QM44F photoimageable thick-film composition may show some degree of tackiness during printing. Therefore, it is a recommended practice to print slowly. Increased snap-off will be helpful as well.

Screen Printing Parameters

</tbody>
</table>

Drying
Allow prints to level 5 - 10 min. at room temperature, then dry in a well ventilated oven for 12 - 14 min. at 80°C. Properly dried film shows slight tackiness when hot and none when cool. Overdried film may require longer time to expose.

Exposure
Photospeed of the dielectric film is quite fast, typical exposure time is 2 - 3 seconds when power is at 11.0 mW/cm². UV light source (Hg) is peaked at 360nm. Optimum result is obtained when phototool is in contact with the film. It is advised to adjust exposure time according to intensity of the light source.

Development
Film is developed in a conveyorized spray developer using 0.8% (wt.) Na2CO3 aqueous solution. To set the proper development time, a dried part (unexposed) is sent through the developer first to determine time to clear (TTC). Then the belt speed of the developer is adjusted so that exposed part is developed at 1.5xTTC. Once the part is developed and water rinsed, excess water should be removed immediately by blowing with an air gun. The preferred solution temperature should be maintained at 85°F (30°C).

Considering that vias will become slightly bigger after firing due to shrinkage, it is recommended to adjust the exposure/development condition such that after development, via size is slightly smaller than artwork.

Firing
Fire each dielectric print separately in a well ventilated conveyor furnace, in air. A 30 minute cycle with a peak temperature of 850°C held for 10 minutes should be used.

Storage and Shelf Life
Containers should be stored, tightly sealed, in a clean, stable environment at room temperature (<25°C). Shelf life of material in unopened containers is three months from date of shipment. Some settling of solids may occur and compositions should be thoroughly mixed prior to use.

Safety and Handling
For Safety and Handling information pertaining to this product, read the Material Safety Data Sheet (MSDS).
