DuPont Performance Materials delivers science-based, high quality thermoplastics to the healthcare industry. These thermoplastics are used in the manufacture of demanding components across many different healthcare segments.
DuPont Performance Materials... a broad range of advanced solutions for healthcare components

DuPont draws on its long experience in materials research, application development, technology, safety and regulatory compliance to provide expert support to healthcare product manufacturers, backed by its global manufacturing and supply strength.

Depending on the specific application, DuPont can deliver an appropriate solution from its broad range of standard products, or from its portfolio of “Special Control” (SC) and “Premium Control” (PC) grades, which are differentiated by a greater degree of testing, manufacturing control and regulatory support.

The Key Properties Our Materials Can Offer Your Products

High Strength
First and foremost, designers are looking for an optimum balance of strength, stiffness and toughness with excellent molding characteristics. The right balance of these properties is the key to designing components for maximum reliability, safety and manufacturability.

DuPont™ Delrin® POM, having the most metal-like behavior of any unreinforced plastic due to its very high crystallinity, is often the first choice for designers.

DuPont also offers a wide range of reinforced engineering plastics for applications requiring even higher stiffness, strength and creep resistance (See Figure 1).

Figure 1: Strength and Stiffness*

*Zytel® conditioned to 50% RH
Low Friction

The selection of appropriate materials in a tribological system (whenever two surfaces rub against each other) is vital to ensure predictable performance and to avoid excessive or variable friction, stick-slip effects, squeaking or eventual total failure.

Secondary lubricants can address these issues but generally tend to be avoided by medical device manufacturers as they require added controls for quantity and placement, contamination control and add one more variable in manufacturing.

DuPont Performance Materials has extensive experience in product development and testing for low wear and friction applications across many industries and offers several grades for medical device manufacturers (See Figure 2).

Flexibility

For applications requiring maximum flexibility DuPont™ Hytrel®, a plasticizer-free thermoplastic polyester elastomer (TPC-ET) – is an innovative solution.

Hytrel® is super-resilient, providing excellent flex fatigue resistance and spring-like properties, and can be used over a wide range of temperatures while still retaining its flexibility and mechanical properties. It enables the design of a variety of parts and products that combine the best features of both high-performance rubbers and flexible plastic materials.

Available in the range of 30 to 82 Shore D hardnesses, Hytrel® is also economical to process, using a variety of molding or extruding technologies (See Figure 3).

Figure 2: Typical Dynamic Coefficient of Friction*

*Dynamic coefficient of friction values can be impacted by load, speed, surface roughness, etc.

Figure 3: Flexibility
Chemical Inertness and Resistance

One of the outstanding properties of semi-crystalline versus amorphous plastics is their resistance to many chemicals, which provides a major benefit in today’s healthcare industry where a wide range of substances is used for analysis, cleaning and disinfection, or as a drug carrier or conserving agent.

Since factors such as temperature, chemical concentration, exposure time, part surface to weight ratio and the plastic component’s stress level can all affect performance, it is highly recommended that a realistic end-use test be run to determine the suitability of a polymer grade in a particular application (See Figure 4).

Figure 4: Chemical Resistance – Hospital Environment

Barrier Properties

The ability of a package to protect its contents (whether in liquid, powder or gel form) against intrusion or loss of $O_2$, $H_2O$ or any other relevant molecule, directly affects the product’s shelf life. A common way for packaging products to obtain the right barrier behavior balance is to use a multi-layer structure. However this solution is not always an option for injection molded products.

DuPont Performance Materials resins offer excellent barrier properties, demonstrating a unique combination of very low water vapor transmission and $O_2$ permeation.

Customers have sought solutions which protect healthcare personnel from patients’ viruses and projections of bodily fluids (blood). They require materials that provide protection but should not prevent the evaporation and evacuation of sweat moisture. Unlike microporous structures, polymeric monolithic membranes made in Hytrel® specialty resins have no pores that can become clogged, and can provide excellent water vapor transmission for increased comfort.
Sterilization Resistance

Sterilization is a vital day-to-day procedure in the Healthcare sector, both for single-use and multiple-use devices, so it is important that materials used in medical components are not affected by this process.

The broad range of materials offered by DuPont Performance Materials provides a suitable solution for nearly every sterilization approach as noted in the table below. This allows manufacturers to select the best material for their specific application requirements (See Table 1).

DuPont Performance Materials... Typical Properties of “SC” and “PC” Grades

These products are manufactured according to Good Manufacturing Practice (GMP) principles and generally accepted in food contact applications in Europe** and the USA when meeting applicable use conditions. These products are also tested against ISO 10993-5 and -11 and selected parts of USP Class VI. For details, individual compliance statements are available from your DuPont representative. Table 2 is a condensed version. For a complete datasheet, please contact your DuPont representative.

The data contained herein reflects typical historical properties for our products and should not be used to establish specification limits.
