Ion exchange resins are an efficient and simple way to purify waste streams and concentrate radioisotopes on a solid substrate before treated liquid is released to the environment or recycled to the nuclear circuits. In certain cases reverse osmosis membranes can be used to upconcentrate the radioactive stream and thus reduce the amount of liquid waste requiring treatment. During decommissioning operations, which mainly occur under water, ion exchange resins are used to purify decommissioning units to increase visibility and remove contaminants, as well as treat effluent when the decommissioning pool is emptied.

### Radioactive Waste Treatment and Decommissioning

#### Product Recommendation

Ion exchange resins are an efficient and simple way to purify waste streams and concentrate radioisotopes on a solid substrate before treated liquid is released to the environment or recycled to the nuclear circuits. In certain cases reverse osmosis membranes can be used to upconcentrate the radioactive stream and thus reduce the amount of liquid waste requiring treatment. During decommissioning operations, which mainly occur under water, ion exchange resins are used to purify decommissioning units to increase visibility and remove contaminants, as well as treat effluent when the decommissioning pool is emptied.

**Key:**
- SBA = Strong Base Anion
- SAC = Strong Acid Cation
- MB = Mixed Bed
- Chel. = Chelating resin
Powering performance worldwide.

With a large global manufacturing footprint, strong R&D expertise and technical support services and systems, we supply high market volumes with high quality. DuPont partners with you, our customer, to understand unmet needs and develop tailored solutions.
