

Product Data Sheet

DuPont[™] AmberLite[™] IRP69 Ion Exchange Resin

Pharmaceutical Grade Cation Exchange Resin (Sodium Polystyrene Sulfonate, USP)

Description DuPont[™] AmberLite[™] IRP69¹ resin is an insoluble, strongly acidic, sodium form cation exchange resin supplied as a dry, fine powder. AmberLite[™] IRP69 Resin is suitable for use in pharmaceutical applications, either as an active ingredient or as a carrier for basic (cationic) drugs. It can be used for sustained release applications with compatible coating technologies.

¹ The use of AmberLite[™] pharmaceutical grade ion exchange resins as components of drug formulations is subject to the Food, Drug, and Cosmetic Act as amended.

Regulatory Status A Drug Master File for AmberLite[™] IRP69 is maintained with the United States Food and Drug Administration (DMF No. 12355). Letters of authorization granting access to the file by FDA in support of NDA and ANDA submittals will be provided upon request. Similar help can also be offered in support of the registration of formulations containing AmberLite[™] IRP69 in many other countries world-wide. AmberLite[™] IRP69 is manufactured in accordance with Good Manufacturing Practices (cGMP) for bulk pharmaceutical chemicals (e.g. Eudralex Vol. 4 Part II, ICH Q7) at the manufacturing site located in Chauny, France.

Typical Properties AmberLite[™] IRP69 complies with the compendial specifications for Sodium Polystyrene Sulfonate USP when tested in conformance to the compendial test methods presented in current USP/NF.

Physical Properties	
Copolymer	Styrene-divinylbenzene
Туре	Strong acid cation
Functional Group	Sulfonic acid
Physical Form	Fine powder
Chemical Properties	
Ionic Form as Shipped	Na⁺
Potassium Exchange Capacity ¹	110–135 mg/g, anhydrous basis
Water Content ¹	≤ 10.0%
Ammonia Salts ¹	Negative to litmus paper
Sodium Content ¹	9.4%–11.5%, anhydrous basis
Styrene Content ²	1 ppm maximum
Particle Size [§]	
> 150 µm	≤ 1.0%
> 75 µm	10.0-25.0%
> 45 µm	≥ 40.0%

[§] For additional particle size information, please refer to the Particle Size Distribution Cross Reference Chart

(Form No. 45-D00954-en).

¹ Appears in current USP/NF.

² If tested against the Ph. Eur. monograph for Sodium Polystyrene Sulfonate.

Identification

DuPont[™] AmberLite[™] IRP69 can be identified by infrared spectroscopy, as shown in the example Figure 1.

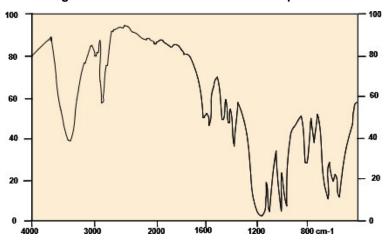

Figure 1: AmberLite™ IRP69 Resin IR Spectrum

Chemical Properties

AmberLite[™] IRP69 is derived from a sulfonated copolymer of styrene and divinylbenzene. The mobile, or exchangeable, cation is sodium; this can be exchanged for, or replaced by, many cationic (basic) species.

Since AmberLite[™] IRP69 is an insoluble salt of a strong acid and a strong base, its ability to exchange ions is virtually independent of pH.

The chemical structure for AmberLite™ IRP69 is shown in Figure 2.

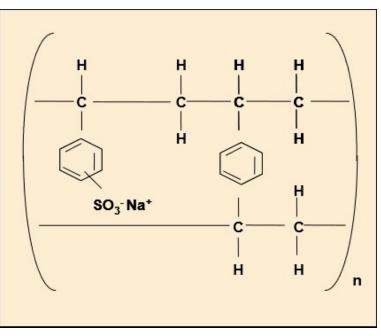

Figure 2: AmberLite™ IRP69 Resin IR Spectrum

Applications	 Taste Masking Drug Stabilization Sustained Release Active Ingredient
	When used as a drug carrier, DuPont [™] AmberLite [™] IRP69 provides a means for binding medicinal agents onto an insoluble polymeric matrix. This can afford an effective means for minimizing problems of taste and odor which may be associated with the drug substance. Controlled or sustained release properties can also be imparted to oral dosage formulations through the formation of resin-drug complexes (drug resinates). The drug is released from the resin in vivo as the drug reaches equilibrium with the high electrolyte concentrations which are typical of the gastrointestinal tract.
	As an active ingredient, AmberLite™ IRP69 can be used as a therapeutic agent to lower potassium levels in the treatment of hyperkaliemia
Drug Loading	Batch equilibration is the preferred practice when loading a drug or other sorbate into finely divided ion exchange resin powders.
	The total cation exchange capacity (~5 meq/g) represents the maximum achievable capacity for exchanging cations. The capacity which will be realized when loading a drug onto AmberLite ™ IRP69 Resin will be less than this ideal; typically loadings will normally be between 5% and 75% of this maximum.
	The actual amount of a drug loaded onto AmberLite™ IRP69 will be influenced by such factors as:
	 the inherent selectivity of the sulfonic exchange groups for the drug. the drug's concentration in the loading solution. the concentration of competing cations also present in the loading solution. the choice of solvent the molecular size of the drug
	.The rate of loading will be affected by the activity of the drug and its molecular dimensions as well as the extent to which the polymer phase is swollen during loading.
	When utilizing a batch or equilibrium contact to load a drug or other cationic sorbate onto AmberLite™ IRP69, complete transfer of the drug from the loading solution is not likely in a single equilibrium stage. Accordingly, more than one equilibration may be required in order to achieve the desired loading onto the resin. The use of two or more loading stages, separating the resin from the liquid phase between stages, is an effective means of achieving maximum loading of the drug onto the resin while maintaining minimum loss of drug from the liquid phase of the final stage. Carefully controlled laboratory experiments are required to establish precise loading
	and elution conditions.

Drug Loading (Cont.)

Drug Release

The rate and completeness of drug desorption in vivo will be affected by:

- The diffusion rate of the drug through the phase of the resin.
- The selectivity of the drug for the resin.
- The nature and concentration of electrolytes in the bulk phase during desorption.

More hydrophobic drugs will usually elute from the resin at a lower rate, owing to hydrophobic interactions with the aromatic structure of the cation exchange system.

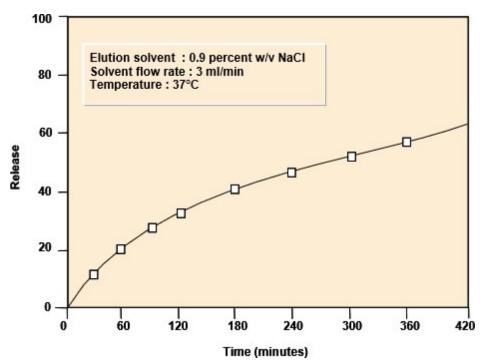

An example of this might be the presence of a transition metal in the structure of the sorbate molecule which can result in considerable selectivity through the formation of a coordination compound with the resin.

The following table and Figure 3 show the typical drug release properties for DuPont[™] AmberLite[™] IRP69 Resin.

Drug Release Characteristics of AmberLite™ IRP69 Resin

% Drug released in 0.1N HCI				
Time,				
minutes	Phenylpropanolamine	Dextromethorphan	Pseudoephedrine	Ephedrine
15	82	21	64	63
30	88	43	66	66
60	92	60	67	68
90	95	71	68	69

Product Stewardship	DuPont has a fundamental concern for all who make, distribute, and use its products, and for the environment in which we live. This concern is the basis for our product stewardship philosophy by which we assess the safety, health, and environmental information on our products and then take appropriate steps to protect employee and public health and our environment. The success of our product stewardship program rests with each and every individual involved with DuPont products—from the initial concept and research, to manufacture, use, sale, disposal, and recycle of each product.
Customer Notice	DuPont strongly encourages its customers to review both their manufacturing processes and their applications of DuPont products from the standpoint of human health and environmental quality to ensure that DuPont products are not used in ways for which they are not intended or tested. DuPont personnel are available to answer your questions and to provide reasonable technical support. DuPont product literature, including safety data sheets, should be consulted prior to use of DuPont products. Current safety data sheets are available from DuPont.
	 Please be aware of the following: WARNING: Oxidizing agents such as nitric acid attack organic ion exchange resins under certain conditions. This could lead to anything from slight resin degradation to
